Abstract
Lignosus rhinocerotis (Cooke) Ryvarden (Tiger milk mushroom) is traditionally used to treat inflammation triggered symptoms and illnesses such as cough, fever and asthma. The present study evaluated the in vitro antioxidant, cytotoxic and anti-neuroinflammatory activities of the extract and fractions of sclerotia powder of L. rhinocerotis on brain microglial (BV2) cells. The ethyl acetate fraction had a total phenolic content of 0.39 +/- 0.11 mg GAE/g. This fraction had ferric reducing capacity of 61.8 +/- 1.8 mg FSE/g, ABTS center dot+ scavenging activity of 36.8 +/- 1.8 mg TE/g and DPPH free radical scavenging activity of 21.8% +/- 0.7. At doses ranging from 0.1 μg/mL to 100 μg/mL, the extract and fractions were not cytotoxic to BV2 cells. At 100 μg/mL, the crude hydroethanolic extract and the ethyl acetate fraction elicited the highest nitric oxide reduction activities of 68.7% and 56.2%, respectively. Linoleic and oleic acids were the major lipid constituents in the ethyl acetate fraction based on FID and GC-MS analysis. Linoleic acid reduced nitric oxide production and down regulated the expression of neuroinflammatory iNOS and COX2 genes in BV2 cells.

Keywords
Author Keywords: Anti-neuroinflammation; Lignosus rhinocerotis; BV2 Cells; Lipid component; Linoleic acid; Oleic acid; Antioxidant
KeyWords Plus: NITRIC-OXIDE PRODUCTION, RAW 264.7 CELLS, COOKE RYVARDEN, MILK MUSHROOM, FATTY-ACIDS, POLYSACCHARIDES, MICROGLOGIA, SYNTHASE, ASSAY
