Homeschooling in Malaysia is seen as having a bright future because of current advances in technology. Homeschooling is a form of education that is beginning to find acceptance in Malaysia. This study will look at the expectations of the future of homeschooling and its implementation in Malaysia in future. The focus on homeschooling that will be given in this working paper is the technology used in homeschooling, the appropriate curriculum as well as the learning model that can be adapted. This paper will discuss to what extent parents are prepared for homeschooling.

Key words: Homeschooling, technology, futures curriculum

Homeschooling clearly fits with human nature that proposes that individual learning should begin from the womb when the foetus is 100 days old, when the spirit is breathed into the body. Ammar Fadzil (2009) has stated that parents are one element, without whom no community can exist since they bring the new generation into society. They play an important role in shaping society and the future civilization. The good and bad in the civilization created will be determined by the parents besides main factors such as the environment and political system. Change and issues that have occurred these days have raised threatening challenges to parents in ensuring their role in shaping human civilization can be carried out satisfactorily.

Hence, the task of supplying human capital that fulfils the needs of society and country in the future falls on the shoulders of parents; at the same time parents are challenged by various social ills that hinder
