Centre of Quranic Research
This book aims at introducing the latest studies and researches conducted in the field of Quranic studies. This is achieved through the participation of researches from all over the world which paves the way for scholarly communication and interaction between scholars and researches. This fruitful book would help to generate ideas and put them into action. Thus, the title of this book, "Qur'anic Research: Interaction of Knowledge, Sciences, and Civilizational", has been chosen. This is to emphasize on the central role that the Qur'an plays in humankind life in realizing interaction and mutual understanding in the fields of knowledge, sciences and the civilizational achievements.

Abstract

Qur'an is the book of Allah sent down to the Prophet Muhammad (S.A.W) in a clear Arabic language. It serves as a final message to the universe and a code of conduct, be it spiritual, social, and moral aspects. It is the primordial source of scientific knowledge and guidance to the past, present and future generations of human beings. Therefore, it is said that Islamic science decline as a result of various forces and hesitate attempts of the contemporary Muslims to continue on the paths of the previous Muslim scientists. Regrettably, today scientific knowledge was transferred from the Muslims to the Western people even though the knowledge was therein the Qur'an. Hence, Muslims have to use their intellects to figure out the mystery and miracles that contain in the Glorious Qur'an. It is believed that Qur'an contains the knowledge of natural sciences, medicine, history, sociology, politics, economics, religion and other fields of social sciences. Almighty Allah revealed the Qur'an for human beings to know how to worship him and to enjoy their temporary staying for the benefit of afterlife. In the Qur'an, in numerous places, Allah instructs mankind to reflect, to think, to ponder on the meaning of the Qur'an. This paper targets to provide the ways and means to restore the study of natural sciences in contemporary Muslims societies in the light of the Qur'anic guidance. It is to awakening the Muslim society to incline to know the teachings of the Glorious Qur'an. This paper is based on qualitative approach. The method of documentary is used in data collection. On the other hand, it employs the usage of content analysis and inductive in data analysis. The findings reveal

that natural sciences in the light of the Qur’anic verses can be found in nature, history and the universe in general.

**Keywords:** Muslim societies, Natural science, and Qur’anic guidance.

**Introduction**

Muslims and even some of the non-Muslims intellectuals believed that Qur’an is the reservoir of sciences. Therefore, figuring Qur’anic sciences is the major task that nevertheless most of the contemporary scholars have neglected. Accordingly, Muslims were everyday reciting the Qur’an in their compulsory daily prayers, but pondering on what it contains is another major problem. Hence, it is significant to note that understanding the meaning of Qur’anic verses is of great importance, and in fact reward is multiplying to whoever recites it. The hearts of believers have only being securing calm in the remembrance of Allah. To understand this statement, Almighty Allah says “Those who believed (in the Oneness of Allah-Islamic Monotheism), and whose hearts find rest in the remembrance of Allah: Verily, in the remembrance of Allah do hearts find rest.”

Moreover, it might be added that Qur’an is a great medicine to physical and spiritual diseases. However, whosoever takes Qur’an as his guidance in his would never lose in this life and the next to come. It is evidently discovered that Qur’an encourages man to use his intellect to study the universe in order to realize the greatness and oneness of the Almighty Allah. Muslim scientists believed that Qur’an is not a book of science but a book of signs Ayat which more than six thousand (6000) verses containing facts, science and symbols. More than one thousand (1000) of these verses talking about what we call today, the modern science. Islamic religion is the ultimate religion that provides man with all the guidance in his endeavours. Thus, it is significant to note that, if there is any religion that invites man to the study and understanding of the heavens, it is Islam. An understanding of the discipline of Astronomy is essential for the appreciation of the religion of Islam. No other religion uses or relies on the heavens and the motion of the moon and sun for timekeeping and calendars as Islam does. Allah created this tremendous Universe that we live in and we are invited to reflect upon it, to understand it so that we may be able to practise our religion with conviction based on reason to the best of our abilities. By God’s laws, the laws of Physics, we are glued to the planet earth yet Almighty God granted us eyes, intellect and knowledge that we may see far in excess of our ordinary reach—surely in these things are signs of the omnipotence of our Creator.

**The Concept of Natural Science**

Understanding what does natural science mean is of highest importance in this paper. Thus, natural sciences are the sciences that are collectively involved in the study of

---

4 Qur’an, Surah, Al-Ra’id, 13: 28.
the physical world and its phenomena, including biology, physics, chemistry, and geology, but excluding social sciences, abstract or theoretical sciences, such as mathematics, and applied sciences?". Similarly, natural sciences are the study of "Embryology, Astronomy: Heavens, Orbits, Sun, Moon, and alteration of day and night as well as Geology, Botany, and zoology." Furthermore, Islamic science means the natural or exact sciences that originated by the Islamic civilization. Arabic was the main scientific language used, but not necessarily the native language of the scientists, who might have been Persian, Turkish or of other origins. Although the term Islamic science and Arabic science are modern historical terms within the context of Islamic civilization, this science is Islamic in the sense that it suited the new and growing needs of the Islamic civilization; was available entirely in Arabic, which had replaced Syriac; and familiar to an increasing number of Muslim translators, students and scientists."

**Qur'anic Verses on Natural Sciences**

Considering the foregoing, it is clearly depicted that natural science encompassed different branches of sciences. Nonetheless, what would be the real fact of its subject is the physical world and what has been surrounded it. Therefore, it should be noted that the Glorious Qur'an emphasizes in numerous places that the universe can be and in fact should be the subject of study, for the universe was created in truth. To substantiate this statement, Almighty Allah says: "He had created the heavens and the earth with truth (bil'-haqq)." In a similar verse, Allah says: "We created not the heavens and the earth and all that is between them except in truth". Commenting on the first verse, al-Maududi says:

That is to say, "The whole system of the Earth and the heavens is a witness to the truth of the doctrine of Tawhid and to the negation of shirk. You may look at anything in the universe and consider the system from any point of view you like, one will find proof of this fact that it is being run by one God and not by many gods. Then how is it that you believe in shirk when there is no proof whatsoever of this in the universe?"

However, in another place, Allah says:

---

8 Bashir Sounjhi, "concept of knowledge from the Western and Islamic perspectives" in Islam knowledge and civilization, by Munawar et al. (UIA: IIUM Press), 27.
10 Hossein Nasr & Iqbal, Islam, Science, Muslims, and Technology (Kuala Lumpur: Islamic Book Trust, 2010), 44.
11 Qur'an, ch. 16: 3.
12 Qur'an, ch. 15: 85
“And on earth there are signs [of God’s existence, visible] to all who are endowed with inner certainty”\(^{14}\). “Just as [there are signs thereof] within your own selves: can you not, then, see”\(^{15}\)? And in heaven is [the source of] your sustenance [on earth]\(^{16}\) and [of] all that you are promised [for your life after death].\(^{17}\)

Given this understanding, it is important to note that recognising the signs of Allah in nature is only benefitting those who believed in His Oneness. Thus, Almighty Allah commanded His servants to study the physical nature of the heaven and earth. Thereupon, he says: “Say: “Behold all that is in the heavens and the earth,” but neither Ayat (proofs, evidences, verses, lessons, signs, revelations, etc.) nor warners benefit those who believe not.”\(^{18}\) Similarly, Allah says: “Do they not look into the realm of the heavens and the earth and everything that Allah has created and [think] that perhaps their appointed time has come near? So in what statement hereafter will they believe”?\(^{19}\)

Moreover, in the structure of the heavens, there are natural signs of Allah, but not to be recognized except those who have deeply ponder on its provision and believe that whoever sets this is the ultimate Creator of all beings. To understand this, Allah says:

Allah is He Who raised the heavens without any pillars that you can see. Then, He raised above (Istawa) the 'Arsh) Throne. He has subjected the sun and the moon, each running [its course] for a term appointed. He manages and regulates all affairs; He explains the Ayat (signs and symbols) in detail that you may believe with certainty in the meeting with your Lord.\(^{20}\)

Commenting on this verse, Ibn Khathir stated that “Allah mentions His perfect ability and infinite authority, since it is He Who has raised the heavens without pillars by His permission and order. He, by His leave, order and power, has elevated the heavens high above the earth, distant and far away from reach. The heaven nearest to the present world encompasses the earth from all directions, and is also high above it from every direction. The distance between the first heaven and the earth is five hundred years from every direction, and its thickness is also five hundred years. The second heaven surrounds the first heaven from every direction, encompassing everything that the latter carries, with a thickness also of five hundred years and a distance between them of five hundred

years. The same is also true about the third, the fourth, the fifth, the sixth and the seventh heavens”.

From the foregoing, the discussion has clearly illustrated the proof of the existence of signs of Allah in the universe, and man when he observes the physical world he will find that there is no one who provided all what are physically available on earth, except Allah who is the Creator and Provider of everything in this world. Although, man has been endowed with the faculty of reasoning only to implement the reality of he studies in the Qur’an, he cannot go against the meaning of Qur’an with thinking that it is based on his discoveries. Once his findings on natural phenomena contradict the intent of Qur’an it will not be accepted. Therefore, it is of great importance to borne in mind that reasoning will never contradicted the Qur’an, but rather implements what the Qur’an prescribed. In this regard, man has limit and it is forbidden for him to go beyond it. No matter how a scientist is, he should try to set his findings within the scope of Islamic principles. It is only in this case that man can fully testify the Oneness and the Greatness of Allah the Most High. He may also believe that his knowledge is nothing but just a little Allah gave him in order to test his faith.

The Importance of the knowledge of Nature

Evidently, nature contains a number of things that Allah provided to human beings, but most of the things need to be carefully study in order to know the wisdom behind their existence. For example, Shaykh Abdullahi bin Foduye advised Muslim Ummah to have the knowledge of nature. Therein, he emphasized that Allah created first the nature of heat from the movement of existence. He then created the nature of cold from the stillness of existence; then he mixed them. By His power out of heat was born dryness and solidification and from cold humidity. They became four singular natures (essence) in one singular spiritual body. Heat made humidity to evaporate and from them Allah created the essence and nature of life and the celestial bodies.

Moreover, Abdullah has further observed that from cold descended solidification and from them He (Allah) created the essence of death and the terrestrial bodies. He poured the celestial bodies over the terrestrial and heat mixed cold, humidity with solidification and the four elements were born by the power of Allah in their orders. From the mixing of heat and humidity the element of air, from the mixing of cold with humidity the element of water and from the mixing of cold with solidification the element of sand which is the earth. He (Allah) then created from it the astral world, which is the first component, then the plants, followed by irrational animals and then by the rational animal-Man-who is the last component and is the object of this study of knowledge. This comprehensive explanation of Abdullah illustrates the evolution of the universe in general. He clearly depicted the various elements that have been composed to produce new object. Therefore, the

21 Ibid.
knowledge of nature is of highest importance to human beings, since all the existence on earth were subservient to mankind. In reality, the observation is to show that the signs of Allah in nature are uncountable. Although, with the guidance of Allah, man may be able to discover a new thing at any moment, this is when he utilizes his intellect in the way and manner that contradicts not the teachings of Islam. Man has to know that Allah is the Creator of whoever called him a scientist. Thus, Almighty Allah is the one who gave him the knowledge and wisdom to figure out what may figure out. Hence, without Allah’s guidance, no matter how he is, he cannot discover anything. Finally, Allah is the Great of the Greatest and His knowledge encompassed everything in this world. The Qur’an stated this categorically, for example Allah says:

... He knows what happens to them (His creatures) in this world, and what will happen to them in the hereafter. And the will never compass anything of His Knowledge except that which He wills.  

The Ways and Means to Vigorously Study the Nature in the Light of Qur’an

Based on the available evidences in the Glorious Qur’an, the contemporary Muslims may find the natural science in the following ways:

1- In history, by using our intellects and senses. Thus, the signs of Allah can be found in history when man observes and experiences the history of the past generations and the nature of their lives in a political, social, moral, and economic setting. For example, Almighty Allah encouraged mankind to travel and experiment the physical world and its different phenomena in order to understand his different signs which testify His Mighty and His Oneness. In this regard, Allah says:

Have they not travelled through the land, and have they hearts wherewith to understand and ears wherewith to hear? Verily, it is not the eyes that grow blind, but it is the hearts which are in the breasts that grow blind.

In view of the above verse, Mehdi Golshani highlighted that the first parts of these verses refer to observation and experimentation and the second part to the use of the faculty of reasoning. Thus, experimental work is an indispensable means for the understanding of nature, but, contrary to what some schools of thought claim, not all of our information about nature comes directly from sensations. If we confine ourselves to sensations and do not use our intellect, we are no better than animals. He therefore supported his argument with the following Qur’anic verse:

And surely, We have created many of the Jinns and mankind for Hell. They have hearts wherewith they understand not, they have eyes wherewith they see not, and they have ears wherewith they hear not.

24 Qur’an, Surah, al-Baqarah, 2: 255.
(the truth). They are like cattle, nay even more astray; those! They are the heedless ones.\textsuperscript{27}

This verse is consciously suggested that once man has not use his intellect to understand the truth of the physical nature of this world and ponder about its Creator he may become like animals who were not endowed with the faculty of reasoning. Therefore, reasoning is of great importance in Islam, but must be with the premise of Islamic principles as stated above. In another place, Almighty Allah stimulated mankind to travel over land in order to reflect on how Allah begins the creation of the universe. The verse reads:

Say: "Travel in the land and see how (Allah) originated creation, and then Allah will bring forth (resurrect) the creation of the Hereafter (i.e. resurrection after death). Verily, Allah is Able to do all things.\textsuperscript{28}

To understand and appreciate the role of history in discovering the physical nature of the universe, Allah says:

Indeed in their stories, there is a lesson for men of understanding. It (the Quran) is not a forged statement but a confirmation of the Allah's existing Books [the Taurat (Torah), the Injeel (Gospel) and other Scriptures of Allah] and a detailed explanation of everything and a guide and a Mercy for the people who believe.\textsuperscript{29}

This verse indicates that civilization comes from history. This is because with the help of the available information about past generations and the way they have manufactured various instruments for the benefit of their live, the contemporary society can build on and improve more to produce better than what they did. This Qur'anic verse has testified that that Qur'an is still alive because is narrating us the story of the past in order to emulate and apply the good lessons to the contemporary situation.

Similarly, in numerous verses in the Qur'ân man is directed to the phenomena of nature and asked and even ordered to study them. "There is fact a very rich Qur'anic vocabulary relating to the study of the phenomena of nature. Such verbs as yarÊ, yafqahÊn, yatadhakarÊn, ya'qilÊn, and ya'lamÊn are used in different verses with different meanings, alluding to the level and depth of understanding the phenomena of nature\textsuperscript{30}". There is implicit in the Qur'an a hierarchy in studying and understanding nature. However, Ziauddin observed that the first Qur'anic word revealed to Muhammad (S.A.W) is "Read", it refers among other forms of readings, to reading the signs of God or the Systematic study of nature. It is a basic tenet of Muslim belief that the Material world is full of signs of God; and these signs can only be deciphered through rational and objective inquiry. Almost one third of the Qur'an is devoted to the praise of scientific knowledge, objective inquiry and serious study of the material world\textsuperscript{31}.

\textsuperscript{27} Qur'an, Surah al-Araf, 7: 179.
\textsuperscript{28} Qur'an, Surah al-Ankabut, 29: 20.
\textsuperscript{29} Qur'an, Surah Yusuf, 12: 111.
\textsuperscript{30} Maurice Bucaille, The Qur'an The Bible and Science ( Kuala Lumpur: Dar al-Wahi Publication), 181.
Therefore, by studying all the above sciences of Allah will definitely restore the vigorous pursuit of natural sciences in contemporary Muslim societies. But the most important thing is, the Muslim should bear in their mind that studying all kinds of natural phenomena is *Ibādah*. In order to understand this point clearly, Sardar considers science as ‘a form of worship which has a spiritual and social function. He further reiterated that “We therefore need to develop mechanisms by which Islamic science, as is dictated by the notion of ‘ii‘im, is moved to the centre of Muslim cultural, social and economic life. In other words, Islamic science, as a pursuit of objective knowledge and as ‘ibadah [worship], occupies the same place in Muslim everyday concerns as prayer, fasting, and other forms of worship’. He adds, a bit more realistically, ‘However, given the current status of Muslim societies, this is a tall order.”\(^{32}\)

Finally, from the above explanation of Sarda we come to the conclusion that studying Islamic sciences is an act of *Ibadah* which if Muslim societies stand sincerely in order to pursue the natural sciences, God will definitely guide them and enlarge their wisdom to find out his signs on natural phenomena. It is also an interesting to note that Sarda’s explanation served as an encouragement to Muslim societies to study Islamic sciences. Therefore, it is only through this ways that the study of natural sciences in contemporary Muslim societies will be restoring vigorously.

2- Another important ways for discovering natural science is through deeply observation of the universe which might evidently testify the major sings of the Creator of the universe. Reference in this assertion is Allah’s saying: “Verily! In the creation of the heavens and the earth, and in the alternation of night and day, there are indeed signs for men of understanding.”\(^{33}\) Thus, only men of understanding can realize the greatness of Allah and the creation of the universe as a subservient to them in order to find the means of their livelihood on earth. This verse indicated the importance of the knowledge of Islamic astronomy. By reflecting the creation of the earth and heaven and alteration of night and day, mankind would realize when and how to do their religious obligations.

In a similar explanation on studying the natural science, it is believed that the moon and the sun are of vital importance in the daily life of every Muslims. By the moon, Muslims determine the beginning and the end of the months in their lunar calendar. By the sun the Muslims calculate the times for prayers and fasting. It is also by means of Astronomy the Muslims can determine the precise direction of Qiblah, to face the Ka‘bah in Makkah, during prayers\(^{34}\).

However, for the importance of determining the timekeeping, the exact times of the five daily prayers are based on the position of the sun in the sky: the

---

\(^{33}\) Al-Qur’an, Al-‘Imran 3: 190.

times of the daylight prayers are determined by the length of shadows, while the
times of prayers when the sun is not above the local horizon are established on the
basis of twilight phenomena. The morning prayer begins at dawn and ends before
sunrise; the noon prayer starts at noon, after the sun crosses the local meridian and
the shadow of a vertical object reaches its minimum; the next prayer starts in the
afternoon, when the length of the shadow of any object is equal to the sum of its
midday minimum shadow and the length of the object casting the shadow; the next
prayer starts after the afternoon prayer and ends before sunset; and the final prayer
starts when the afterglow disappears and should end before midnight. Although it is
not difficult to estimate these prayer times empirically, to determine them
accurately one needs to acquire a good knowledge of the local coordinate system
and the day-to-day changes in the apparent position of the sun in the sky\textsuperscript{35}.

In determining the direction of the Qibla, it is of great importance to recall
the history. Hence, during the first thirteen years of the rise of Islam, Muslims faced
Jerusalem while praying. However, seventeen months after the Hijra—the migration
of the Prophet Muhammad from Mecca to Medina—the orientation of prayers (Qibla)
changed so as to be towards the Kaaba in Mecca. Since Mecca is located south of
Medina, finding the Qibla in Medina was not difficult. However, once the Islamic
territories expanded, finding the right Qibla became a challenging problem in
spherical geometry. The problem was to find the direction of the great circle passing
through two points on the globe. Over the centuries, Muslim astronomers and
mathematicians developed methods to solve this problem based on spherical
trigonometry, and produced tables and even sophisticated instruments to find the
orientation of Mecca from different locations\textsuperscript{36}.

The foregoing findings of scientist show there is possibility of discovering
many galaxies by continuing conducting research on astronomy. It is perhaps that
when Muslims strive hard in the light of Qur'anic verses and views of the Muslim
scientists as well as the Mufassirun, many things may be understood regarding
the knowledge of Islamic Astronomy. Since Allah gives man the ability to think, so is
only left to him to exercise his own faculty of reasoning to understand the
universe.

3- Through physical observation of oneself: Natural science can be found when one
looks at his own structure. He would realize that Allah has given him certain features
that he did not give to others. That is why Almighty Allah created human beings on
different shapes and in different categories. Some are taller than others, likewise,
some are blacks and others are white or mixed. In some cases some have red skins
among other things. This shows nothing but the signs of Almighty in his creator. This
is according to the physical nature man, but according to the internal features, since
before his presence in this world, many things happen which might have further
testified the Greatness of Allah. The science of anatomy here is indeed evidence to
the Magnificence of Allah Who has no assistant or supporter in creating or doing
whatever he wishes. To understand this statement Allah says:

\textsuperscript{35} 6 June, 2015. “http://www2.astronomicalheritage.net/index.php/show-theme?idtheme=15”. Note, the
contents of this page are based upon text in the ICOMOS–IAU Thematic Study. Original text © Clive
Ruggles, Michel Cotte and the contributing authors.
Then We made the *Nutfah* into a clot (a piece of thick coagulated blood), then We made the clot into a little lump of flesh, then We made out of that little lump of flesh bones, then We clothed the bones with flesh, and then We brought it forth as another creation. So blessed be Allah, the Best of creators.\(^{37}\)

For understanding the above verse, Ibn Kathir declared that the verse is evidently displayed the sign of Allah in the progressive creation of Man from clay then from *Nutfah* and thereafter. He therefore asserted that Allah tells us how He initially created man from an extract of *Tin*. This was Adam, peace be upon him, whom Allah created from sounding clay of altered black smooth mud. Ibn Jarir said, "Adam was called *Tin* because he was created from it." Qatadah said, "Adam was created from *Tin*." This is the more apparent meaning and is closer to the context, for Adam, upon him be peace, was created from a sticky *Tin*, which is a sounding clay of altered black smooth mud, and that is created from dust.\(^{38}\)

**Conclusion**

The aforementioned discussion had played a significant role in providing the detailed explanations on the ways and means to restore the vigorous study of natural sciences in contemporary Muslim societies. Also, it is well understood that interest in natural phenomena is one of the leading factors in achieving this goal, because lack of interest is among the major factors that lead to the decline of the study of natural sciences in the Muslim countries. Therefore, contemporary Muslim scholars have to apply all the ways and means in their studies in order to discharge their religious responsibilities in the society. This can only be achieved through constant reading and reflecting the meaning of the Qur’anic verses. It is believed that nothing has been left out in the matters of Qur’an. The task of finding solutions to the challenges of contemporary Muslim world depends on the seriousness of Muslim *Ummah* to vigorously study the physical nature of the universe.

It is also suggested that contemporary Muslim societies should understand that ‘*aql* (reasoning) is an instrument that Allah gave man to acquire knowledge. In doing so, Muslims do not relax to observe and experience the physical world in order to discover the natural sciences. More importantly, Muslims need to do much more than what the previous generation of Muslim scientists did in studying the natural sciences.

Finally, “Muslims need to realize that there is no quick fixes science, and scientific spirit, cannot be brought or transferred. It must emerge from within a society and scientific activity must be made meaningful to the needs and requirements of a people. There is no substitute for rolling one’s sleeves and going to the laboratory. Only by touching and transforming the lives of ordinary Muslims can science develop as a thriving enterprise\(^{39}\).”

\(^{38}\) Ibn Kathir.
