Study of the armed conflict and tsunami as sources of trauma among juvenile in Aceh conducted due to some assumptions that Aceh was in a prolonged armed conflict of the region’s history and was destroyed by a huge earthquake and tsunami. This study was conducted to determine the level of trauma experienced juvenile victims of armed conflict and tsunami in Aceh. Study also to know the differences of source of trauma and districts in Aceh. A total of 1185 high school juvenile has become respondents. This study applies the Manual Standard Trauma Symptom Inventory (TSI) that has been translated into the local language. The study was conducted using purposive sampling using the survey method. The results showed that level of juvenile trauma in Aceh is at a moderate level. The results further indicate that the trauma caused armed conflict more than the tsunami impact of trauma. Another results indicates that the Bireun, South Aceh and Abdya districts more high level of trauma than others.

Keywords: Trauma, Juvenile Victims, and Trauma Symptom Inventory.

INTRODUCTION

Trauma is the wound that happened in someone the results of the scary events such as murder threat, accident, natural disaster, war, and other incident that can make somebody afraid, worry, under pressure and sad. All incidents can make everyone suffer in this world and at every age level. If they do not get the good guidance it can lead them to the physical and mental disturbance. Shapiro (1999) stated that trauma is the experience in life that disturbs the biochemistry balance from the system of brain psychological process. This balance blocks information process to continue processing something to achieve the adaptive perception, emotion, believe, and meaning derived from the experience that is locked in the neuron system.

According to Janawi (2007) stated trauma is a psychological disturbance that is so dangerous and can disturb the balance of human life. Although Cavanagh in Mental Health Channel (2004) stated the statement of trauma definition as a spectacular event that cause not only wound and hurt, but also serious wound or hurt feeling caused by incredible events that affect someone directly or indirectly, which cause the physical or mental wound, or the combination both of them. Whether hard or easy, the event will be felt differently by each other, so that the influence from the event to the behavior is also different from each other.
